AMENDMENT(S) TO THE SPECIFICATION:

Kindly amend paragraph [0032] as follows:

[0032]   According to another known method, sometimes called "message in message" or "stomp and restart," a receiving station ~~remebers~~ remembers the signal strength of a received signal, but maintains its start-of-packet detection circuitry active. If another stronger signal arrives, the receiver aborts processing on the weaker signal and tries to demodulate the stronger signal.
